AI-POWERED PM OPERATING SYSTEM

Nik*laude*

A personal AI copilot that knows my context, runs my workflows, and builds itself while I'm in meetings

Niki Birkner · Together AI · April 2026

Starting from zero, every single day

- Meeting notes piling up, action items falling through the cracks between six open tools
- PRD reviews dragging on for 2 weeks of async back-and-forth across 6+ stakeholders
- Competitive research eating 3+ hours a week of manual monitoring
- Every Monday starting fresh — no memory of last week's decisions, blockers, or priorities
- Six tools open, nothing connected, constant context switching, no single source of truth

> I wanted an AI that **knows my context** — not one that just responds to prompts.

Not a chatbot. *A system.*

- → **Claude Code** as the orchestration layer — reads all my context at session start, drives every workflow
- → Knows my stakeholders, writing style, product strategy, and every open decision
- → Connected to Notion, Todoist, Linear, Calendar, Gmail, Readwise, and Granola
- → **117 slash commands** covering every PM task — daily planning, PRD review, research synthesis, competitive analysis
- → **13 scheduled automations** running without me — meeting notes, news monitoring, context refresh

Claude AI	117 skills
Context Library	18+ files
Automation Engine	13 systems
niklaude.com	40+ routes
MCP Integrations	6 tools

Four layers, always in sync

LAYER	WHAT IT DOES	SCALE
Claude AI	117 slash commands for every PM task — daily plan, PRD review, competitive analysis, strategy, research synthesis	117 skills
Context Library	Stakeholder profiles, strategy docs, writing styles, decision log. Read at every session. Refreshed nightly by automation.	18+ files
Automation Engine	Scheduled systems: meeting summaries, competitive news, context updates, action item follow-up, weekly planning drafts	13 systems
niklaude.com	Full dashboard — tasks, notes, docs, goals, and a command tab that routes natural language to the right action	40+ routes

work/ and **personal/** are hard-separated. Two Notion workspaces, two Todoist projects, two note directories. If I change jobs, the personal layer detaches cleanly — zero contamination.

7 expert reviewers. *10 minutes.*

- PRD feedback normally takes 2 weeks — different reviewers catch different gaps, never at the same time
- `/prd-review-panel` dispatches 7 specialized agents *in parallel*, not sequentially
- Convergence detection: 3+ agents flagging the same issue = fix it first
- Conflicting perspectives surfaced explicitly — engineer says feasible, skeptic says risky, both visible

> What used to be a 2-week async email chain is now a **10-minute parallel run** with richer coverage than any human review cycle.

Engineer
Feasibility, complexity, scale

Designer
UX quality, edge cases, a11y

Executive
Strategic fit, business impact

Legal
Compliance, privacy, data risk

UX Researcher
Evidence quality, bias

Skeptic
Challenges every assumption

Customer Voice
Adoption friction, real user perspective

Back from 10 days OOO. *Caught up in 20 minutes.*

After 10 days in Argentina, `/catch-up` dispatches 5 parallel scout agents that scan everything at once — meetings, PRDs, decisions, action items, strategy docs.

- → **What shipped** while you were gone — with owners and dates
- → **What slipped** — items that need your attention now
- → **Day 1 action list** — prioritized by stakes (external > internal > optional)
- → **Convergence items** — when 3+ scouts flag the same thing, it leads the list
- → **Stale items** — open decisions older than 30 days that need resolution

The old way: 2 hours of Slack scrolling, calendar review, email triage, and asking teammates "what did I miss?"

The new way: one command, five scouts in parallel, a structured Day 1 brief in 20 minutes.

Same pattern works for customer interview synthesis, competitor analysis, and cross-PRD impact sizing — any multi-source research task.

Zero manual note-taking. *Ever.*

Granola Transcribes → **Classify Meeting Type** → **Generate Notes** → **Push to Notion** → **Create Todoist Tasks**

Captures audio during meetings automatically

11 categories: 1:1, cross-functional, external, sprint, all-hands...

Decisions, action items, context — structured and searchable

Work meetings → Work Notion only. Personal → Personal Notion.

Right project, priority, due date — automatically

30m	2–3h	11
RUNS EVERY 30 MIN, 7AM–7PM	SAVED PER WEEK, EVERY WEEK	MEETING TYPES HANDLED AUTOMATICALLY

Competitive intel on *autopilot*

BEFORE

- → Manual monitoring of OpenAI, Anthropic, Fireworks, AWS, Google blogs
- → 3+ hours per week, always a day behind, miss weekends
- → JS-rendered pages break RSS, key announcements slip through
- → Competitive moves reach the team days late, if at all

AFTER

- → LLM classifier reads **24+ articles daily** via Together AI models
- → **Breaking news** → Slack #ai-news immediately 🚨
- → **Relevant intel** → daily digest at 9am 📰
- → Firecrawl handles JS-rendered pages — no broken feeds
- → **Zero manual hours.** Runs 24/7 on a cron job.

What used to require a dedicated analyst now runs automatically. **Real-time competitive awareness without touching it.**

The AI knows *your world*

- → **Stakeholder profiles** — 15-20 people: communication styles, priorities, sensitivities, what they need to see first
- → **Strategy docs + 7 PM frameworks** — 7 Powers, JTBD, PLG Iceberg, Growth Loops, Hook-Retain-Expand
- → **Writing style guides** — 4 audience modes: internal, executive, technical, user-facing
- → **Business context** — product areas, business model, key metrics, roadmap state, active initiatives
- → **Decision log** — every major product decision captured with rationale, forever searchable

A nightly automation (`self-update-context`) reads the last 7 days of outputs, meetings, and decisions — and refreshes the context files automatically. Claude always wakes up current.

Result: Claude knows Together AI's business, my stakeholders, my writing voice. Not generic PM advice. Advice for my exact situation, right now.

A real dashboard for the real work

- → **Dashboard** — overdue alerts, today's focus, week ahead, recent captures. One API call, zero config.
- → **Tasks** — Todoist integration with live inline editing, natural language due dates, real-time regrouping by priority/project/date
- → **Notes** — unified browser across work + personal notes, auto-deduplicated, tagged, filterable
- → **Work hub** — all PRDs, decisions, analyses, strategies, and comms in one place
- → **Command tab** — "create a p1 task for X by Friday" routes to the right action via LLM classification

This presentation *built itself.*

- **10:00am** Niki gives Claude one prompt and walks into a 30-minute meeting
- **10:00am** **3 agents launch in parallel:** repo explorer, site explorer, session log scanner
- **10:08am** All 3 return with architecture overview, demo highlights, and specific impressive examples from real logs
- **10:08am** **3 more agents launch:** slide designer, architecture doc writer, README updater
- **10:25am** All complete. Committed and pushed to GitHub automatically. No permission asked.
- **10:30am** Niki walks in. **Deck is already open in the browser.**

6 agents. 30 minutes. Repo exploration, site analysis, session log mining, slide design, architecture doc, README update — all in parallel, zero manual work.

This isn't a one-time demo. This is how the system works every day — PRDs, meeting notes, competitive analysis, weekly planning — all delegated to agents while Niki focuses on the actual thinking.

The ask that produced this: **"make me a presentation for my manager, push it, I have 30 minutes."**

What if the whole product org ran like this?

Shared PM Context Library

Every PM's stakeholders, strategies, and styles in one place. New hires onboard to full org context in week 1, not month 3.

Competitive Intel, Shared

AI News Bot posts to a team channel. Every PM sees OpenAI/Anthropic moves in real-time. No dedicated analyst required.

Team PRD Review Panel

7-agent review as a gate before any spec goes to engineering. Catches legal risk, complexity, and UX gaps before they're expensive mistakes.

Cross-PM Standup Roll-Up

Every PM's standup aggregates into a leadership digest — what's shipping, what's blocked, what needs exec attention. No extra meeting.

Sales → PM Signal Pipeline

Customer feedback from sales calls classified and routed to the right PM automatically. No more "I heard a customer say this over Slack."

Org Decision Log

Every product decision with rationale, forever searchable. "Why did we build it this way?" finally has an answer anyone can find.

What's actually in the box
